

Five things to know about herd immunity

1

Herd immunity, also called “community immunity,” occurs when a large percentage of the population is immune to a specific disease, meaning it can no longer easily spread person to person.

2

Herd immunity protects everyone, including at-risk populations, and is key to ending this pandemic for all of us.

3

Health experts estimate between **70-85% of the population** will need to be immune, either through **natural resistance or through vaccination**, before we reach herd immunity against COVID-19.

4

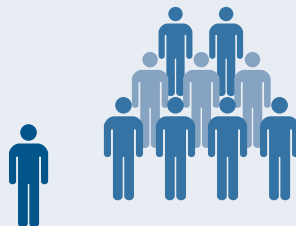

Widespread vaccination is the best and safest route to herd immunity against COVID-19.

5

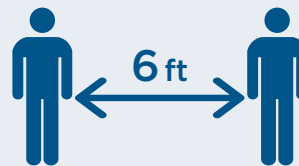

Until we reach herd immunity, following these safety protocols is the best way to keep us all safe:

Wear a mask

Avoid large gatherings

Physical distance

Good hand hygiene
